

Project - 1: Deploying a Multi-Tier Website Using AWS EC2

Description:

Amazon Elastic Compute Cloud (Amazon EC2) provides scalable computing capacity in the Amazon Web Services (AWS) cloud. Using Amazon EC2 eliminates your need to invest in hardware up front so you can develop and deploy applications faster. You can use Amazon EC2 to launch as many or as few virtual servers as you need, configure security and networking, and manage storage. Amazon EC2 enables you to scale up or down to handle changes in requirements or spikes in popularity, reducing your need to forecast traffic.

Problem Statement:

Company ABC wants to move their product to AWS. They have the following things set up right now:

- 1. MySQL DB**
- 2. Website (PHP)**

The company wants high availability on this product, therefore wants Auto Scaling to be enabled on this website

Steps To Solve:

1. Launch an EC2 Instance
2. Enable Auto Scaling on these instances (minimum 2)
3. Create an RDS Instance
4. Create Database & Table in RDS instance:
 - a. Database name: intel
 - b. Table name: data
 - c. Database password: intel123
5. Change hostname in website
6. Allow traffic from EC2 to RDS instance
7. Allow all-traffic to EC2 instance

EC2 > ... > Launch an instance

Launch an instance

Info

Amazon EC2 allows you to create virtual machines, or instances, that run on the AWS Cloud. Quickly get started by following the simple steps below.

1. `sudo su` ---> to convert into root user
2. `apt-get update` ----> to get latest packages which are installed in ubuntu
3. `apt install apache2 -y` ---> to install web server
4. `systemctl status apache2` ---> to check the status of your web server
5. `cd /var/www/html`
6. `rm index.html`
7. `nano index.php`

---> copy the contents of index.php into the terminal

---> `ctrl + s` -> to save the file

---> `ctrl + x` -> exit the editor

8. `apt-add-repository -y PPA:ondrej/php` ----> to add the repository into ubuntu instance which enables us to install the required php version
9. `apt install php5.6 mysql-client php5.6-mysqli -y` ---> installing the required packages

Templates

Choose a sample template to meet your use case.

☐ Production
Use defaults for high availability and fast, consistent performance.

☐ Dev/Test
This instance is intended for development use outside of a production environment.

☒ Free tier
Use RDS Free Tier to develop new applications, test existing applications, or gain hands-on experience with Amazon RDS.

Availability and durability

Settings

DB instance identifier [Info](#)

Type a name for your DB instance. The name must be unique across all DB instances owned by your AWS account in the current AWS Region.

project-database-1

The DB instance identifier is case-insensitive, but is stored as all lowercase (as in "mydbinstance"). Constraints: 1 to 60 alphanumeric characters or hyphens. First character must be a letter. Can't contain two consecutive hyphens. Can't end with a hyphen.

▼ Credentials Settings

Master username [Info](#)

Type a login ID for the master user of your DB instance.

intel

1 to 16 alphanumeric characters. The first character must be a letter.

Credentials management

You can use AWS Secrets Manager or manage your master user credentials.

☐ Managed in AWS Secrets Manager - *most secure*
RDS generates a password for you and manages it throughout its lifecycle using AWS Secrets Manager.

☒ Self managed
Create your own password or have RDS create a password that you manage.

☐ Auto generate password
Amazon RDS can generate a password for you, or you can specify your own password.

Master password [Info](#)

Password strength

Master password [Info](#)

.....

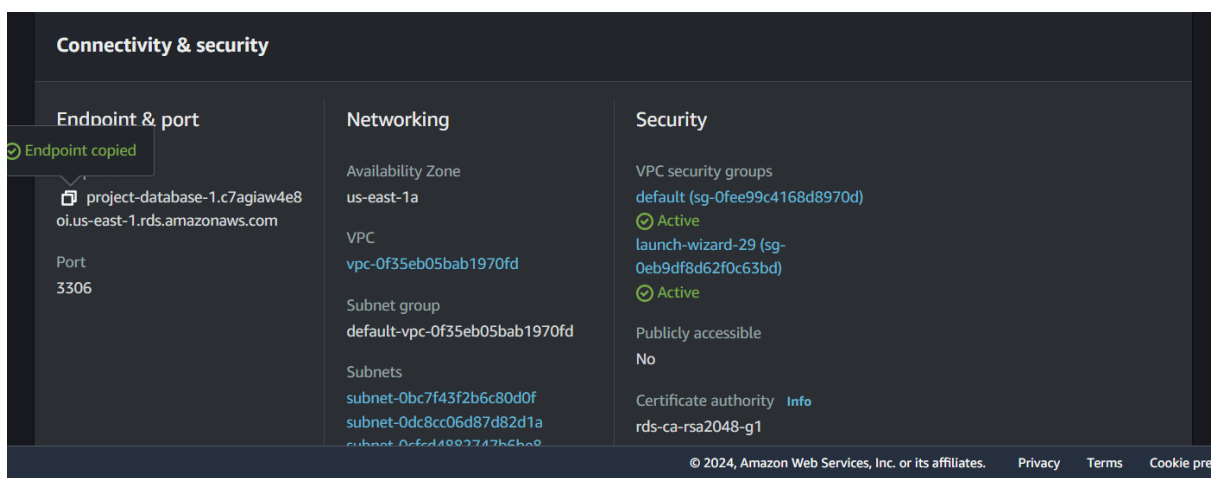

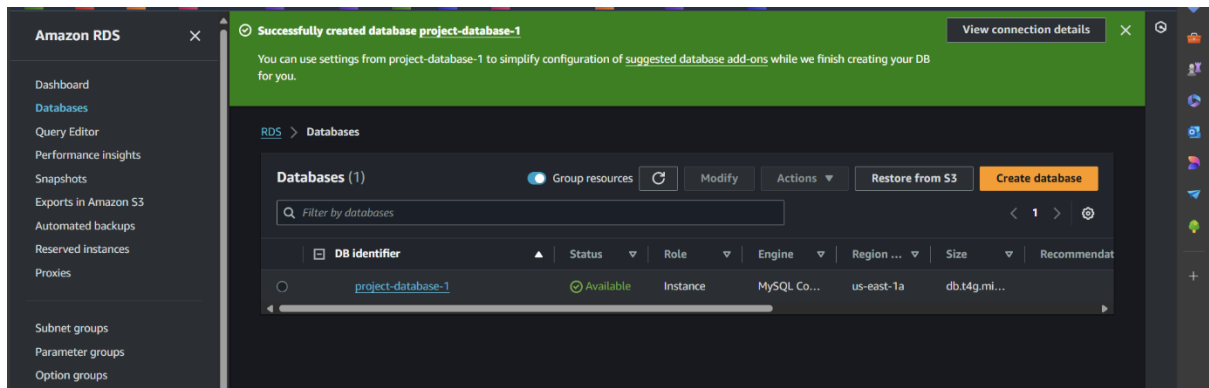

Password strength [Info](#)

Weak

Minimum constraints: At least 8 printable ASCII characters. Can't contain any of the following symbols: / ' " @

Confirm master password [Info](#)

..... 

Connect the instance and enter the following commands

1. `mysql -h project-databaseinstance.cvwwkjmmcvgi.us-east-1.rds.amazonaws.com -u intel -p` ---> connecting to mysql shell
2. `show databases;`

```
mysql> show databases;
+-----+
| Database |
+-----+
| information_schema |
| intel      |
| mysql     |
| performance_schema |
| sys       |
+-----+
5 rows in set (0.00 sec)
```

3. `use intel;`
4. `show tables;`
5. `create table data(firstname varchar(50),email varchar(50));`
6. `insert into data(firstname, email) values ("satvik","satvikintellipaat@gmail.com");` ---> insert temp data into data table

7. select * from data;

```
mysql> select * from data;
+-----+-----+
| firstname | email |
+-----+-----+
| shreyas   | shreyasbhing@gmail.com |
+-----+-----+
1 row in set (0.00 sec)

mysql> |
```

- Edit index.php file

```
root@ip-172-31-9-207: /var/w  ×  +  v
root@ip-172-31-9-207:/var/www/html# nano index.php|
```

- Change service name and enter endpoint of database

```

Create the image

Create the launch template

Create the Auto scaling

Step 6 - optional

Add tags

Step 7

Review

Attach to a new load balancer

Define a new load balancer to create for attachment to this Auto Scaling group.

Load balancer type

Choose from the load balancer types offered below. Type selection cannot be changed after the load balancer is created. If you need a different type of load balancer than those offered here, visit the [Load Balancing console](#).

☒ Application Load Balancer

HTTP, HTTPS

☐ Network Load Balancer

TCP, UDP, TLS

Load balancer name

Name cannot be changed after the load balancer is created.

project-autoscaling-1

Load balancer scheme

Scheme cannot be changed after the load balancer is created.

☐ Internal

☒ Internet-facing

Network mapping

Your new load balancer will be created using the same VPC and Availability Zone selections as your Auto Scaling group. You can select different subnets and add subnets from additional Availability Zones.

VPC

vpc-0f3Seb05bab1970fd

Default routing

If you require secure listeners, or multiple listeners, you can configure them from the [Load Balancing console](#) after your load balancer is created.

Protocol

Port

Default routing (forward to)

HTTP

80

Select new or existing target group

Q

Create a target group

Tags - optional

Consider adding tags to your load balancer. Tags enable you

Add tag

50 remaining

VPC Lattice integration options

Info

Step 4 - optional

Configure group size and scaling

Step 5 - optional

Add notifications

Step 6 - optional

Add tags

Step 7

Review

Desired capacity type

Choose the unit of measurement for the desired capacity value. vCPUs and Memory(GiB) are only supported for mixed instances groups configured with a set of instance attributes.

Units (number of instances)

Desired capacity

Specify your group size.

3

Scaling

Info

You can resize your Auto Scaling group manually or automatically to meet changes in demand.

Scaling limits

Set limits on how much your desired capacity can be increased or decreased.

Min desired capacity

Max desired capacity

1

3

Equal or less than desired capacity

Equal or greater than desired capacity

Automatic scaling - optional

Choose whether to use a target tracking policy

Info

You can set up other metric-based scaling policies and scheduled scaling after creating your Auto Scaling group.
